

Figure 13. Power analysis: attribution-share MAPE vs DGP ground truth, by sample size. Each line is one model; x-axis log-scaled. Dotted vertical line = crossover where TreeMMM MAPE rises above GLMM-Naive. Single seed (seed=42) at each scale — smaller-n cells exhibit visible seed noise; the headline 3,000 column is corroborated by 5-seed CIs (Section 5.1, Table 2a). Non-monotonic lines (e.g. TreeMMM pharma 17→28→11→16%) are single-seed variability, not model pathology.
