

Figure 13. Cap-bounded HCP-level budget landing on the pharma DGP. Panel A: aggregate lift vs budget level, mean +/- SE over 5 seeds; bands are seed dispersion, not a calibrated confidence interval. Panel B: the +25% increment fills headroom below the per-customer cap and avoids cells already saturated (gray). The tactic is already chosen; this is a committed-increase landing simulation, not a net-new optimizer.
